WEB APPLICATIONS

Web Applications

WEB APPLICATIONS

Prerequisites

- Managed account for AppPool
- Database server and database name
- IIS site name, port, [host header], [ssl], [diskPath]
- AppPool name
- Authentication method
 - NTLM, Kerberos, Claims-based authentication
- Add-SPShellAdmin
- Define DNS CNAME/A
- Enable Kerberos SPN and AES

Requirements

- **SP Admins** must be **DBCreator** and **SecurityAdmin** in the DB instance
 - in case you are provisioning through **Central Administration**, the sp-farm must have the roles

Lab: Create Intranet...

- Create `sp-intranet` service account
 - add to `SP Managed Accounts` and `Service Accounts` groups
 - you can use the shadow group script
- In SQL instance `DB1\SPContent` create login
 - `SP Admins, DBCreator + SecurityAdmin`
- Define SharePoint managed service account
 - `New-SPManagedAccount`

Lab: ... Prepare to monitor OWSTRIMER and WSSADMIN...

- On WFE1 start PROCMON
- Enable Filter to see only Path which begins with `F:\SP-Intranet` and/or `applicationHost.config`
- Start capturing events

Custom defaults for web.config

- %sharepointroot%\CONFIG
- web.config
 - the default **web.config** file which gets copied into each web application directory
- webconfig.something.xml
 - the **<add>** and **<remove>** elements to apply into the default web.config dynamically
- <configSections>
 - custom elements must be predefined unless are not read

Lab: ...Create Intranet

- **New-SPWebApplication**
 - -DatabaseServer spcnt
 - -DatabaseName SPIntranetContent
 - -Name SP-Intranet
 - -Path E:\SP-Intranet
 - -Url http://intranet
 - -Port 80
 - -AuthenticationMethod Kerberos
 - -ApplicationPool SP-Intranet-AppPool
 - -ApplicationPoolAccount gps\sp-web
- **New-SPShellAdmin**
 - -UserName "gps\sp admins"

Lab: Verify Intranet (WFE1)

- Verify DB exists and the **SharePoint_Shell_Access** DB role
- Verify IIS Web Site has been created
- Verify classic-mode **Windows Authentication** is enabled
 - **Providers** = Negotiate (Kerberos), NTLM
- Verify AppPool has been created and is started
 - verify the **w3wp.exe** process is not running yet
- Verify the **E:** disk path location has been populated with a basic set of files
 - **web.config**
 - check permissions contain **WSS_WPG** group

Lab: DNS and SPN

- Define DNS alias (A) for intranet
 - intranet = A = IP 10.10.0.55
- Define SPN and check uniqueness
 - `setspn -a "http/intranet" sp-intranet`
 - `setspn -a "http/intranet.gopas.virtual" sp-intranet`
 - `setspn -q "http/*"`
- AES for sp-intranet AD account
 - `msDS-SupportedEncryptionTypes = 28`

Lab: Create Extranet (SPCA)

- Create new managed service user `sp-extranet`
- `New-SPAuthenticationProvider`
 - `-UseWindowsIntegratedAuthentication`
 - `-UseBasicAuthentication`
 - `-DisableKerberos $false`
- `New-SPWebApplication`
 - `-DatabaseServer spconfig`
 - `-DatabaseName SPExtranetContent`
 - `-Name SPExtranetInternal`
 - `-AppPoolName SPExtranetAppPool`
 - `-Url http://extranet`
 - `-AppPoolAccount gps\sp-extranet`
 - `-Port 80`
 - `-AuthenticationProvider $provider`
- `Add-SPShellAdmin`

Lab: DNS and SPN

- Define DNS alias (A) for extranet
 - `extranet = A = IP 10.10.0.57`
- Define SPN and check uniqueness
 - `setspn -a "http/extranet" sp-extranet`
 - `setspn -a "http/extranet.gopas.virtual" sp-extranet`
 - `setspn -q "http/*"`
- AES for sp-extranet AD account
 - `msDS-SupportedEncryptionTypes = 28`

Lab: Create AppPool Profiles

- Log on to **all** SharePoint web servers and run Command Line as all of AppPool identities
- Verify that the local profile has been created in C:\Users folder

Web Applications

MANAGED PATHS AND SITE COLLECTIONS

Lab: Define Managed Paths

- **New-SPManagedPath**
 - -RelativeURL
 - -Explicit:\$false
 - -WebApplication

Lab: Content Database

- **New-SPContentDatabase**
 - -Name
 - -WebApplication
 - -DatabaseServer
 - -MaxSiteCount
 - -WarningSiteCount
- **Add-SPShellAdmin**
- **Test-SPContentDatabase**
 - and verify on all WFEs that the binaries are ok

Lab: Site Collections

- Import-Module ActiveDirectory
- `Get-Help Get-SP*template*`
- `New-SPSite`
 - -Url
 - -ContentDatabase
 - -Description
 - -Language
 - -Name
 - -QuotaTemplate
 - -OwnerAlias
 - -SecondaryOwnerAlias
 - -Template `blank`

Lab: Sites

- `New-SPWeb`
 - -Url
 - -Description
 - -Language
 - -Name
 - -Template
 - -UniquePermissions
- `AddToTopNav, AddToQuickLaunch, UseParentTopNav`

Lab: Test Kerberos Access

- Log on to **Client1** as **gps\sp-install**
- Try accessing **http://intranet/sales**
- Use **KLIST** to display the **http/intranet** Kerberos ticket is present

Web Applications

REQUEST PROCESSING

Request Processing

- TCP session established
- HTTP.SYS in kernel mode
- WAS service starts W3WP.exe worker process for the AppPool
- W3WP authenticates the user if requested
- SPRequestModule produces output
 - from database or from disk
- ASP.NET compiles pages into memory or some to disk as well
 - %windir%\Microsoft.NET\Framework64\4.0\Temporary ASP.NET Files

Lab: Testing ASP.NET compilation

- Verify that 32bit framework does not run
 - %windir%\Microsoft.NET\Framework\4.0\Temporary ASP.NET Files
 - should be empty
- Delete contents of the 64bit framework cache
 - %windir%\Microsoft.NET\Framework64\4.0\Temporary ASP.NET Files
- Access <http://intranet> and watch the speed and the final size of the compilation results
 - verify that the folder does not contain anything like "home", "allitems" etc.

Web Applications

ALTERNATE ACCESS MAPPINGS

Extending vs. AAM

- Extend Web Application
 - up to 5 IIS web sites – **zones**
 - different authentication and user/anonymous policy
 - different port/host-headers on IIS bindings
- Alternate Access Mappings
 - is not meant as redirection means

Alternate Access Mappings

- Zones = URL sets
 - names are just labels
 - no functional difference except for Default
 - Default, Intranet, Extranet, Internet, Custom
- Public URL
 - what a users types into the address bar
 - all links and redirects get this URL
- Internal URL
 - what SharePoint accepts
 - should have equivalent host header binding

Zones

- URL sets
- Web Application User Policies
- Authentication

Lab: Extend intranet for SSL

- Use Central Administration to extend the <http://intranet:80> web application
 - name **SP-Intranet-SSL**
 - path **E:\SP-Intranet-SSL**
 - port **443**, use **SSL**
 - authentication **Kerberos**
 - zone **Intranet**

Lab: Changing IIS Binding

- Use Central Administration to **delete all IIS sites** and then extend the application to Default zone

Changing IIS bindings

- `$wa = Get-SPWebApplication`
- `$site = $wa.IISSettings.Item('Default')`
- `$site.ServerBindings`
- `$bind = New-Object Microsoft.SharePoint.Administration.SPServerBinding`
- `$bind.HostHeader = 'intranet.gopas.virtual'`
- `$site.ServerBindings.Add($bind)`
- `$wa.Update()`
- `$wa.UnprovisionGlobally()`
- `$wa.ProvisionGlobally()`

Lab: Change Classic to Claims

- `Get-SPWebApplication`
- `Set-SPWebApplication`
 - `-AuthenticationProvider (New-SPAuthenticationProvider) -Zone Default`
 - `or`
- `.UseClaimsAuthentication = $true`
- `.Update()`
- `.MigrateUsers($true)`
- `.Deploy()`

Lab: Change Claims back to Classic

- Get-SPWebApplication
- .UseClaimsAuthentication = \$false
- .Update()
- .MigrateUsers(\$true)
- .Deploy()

Web Applications

CACHE

Caches

- **No support in Foundation**
 - Output and Object cache requires Publishing Feature
- Output cache
 - used only by Publishing feature
- Object cache
 - used only by Publishing feature
- Blob cache
 - local disk storage to cache files from SQL
 - separate from RBS storage on SQL server
 - does **not require Publishing Feature**

System Account

- **System Account** is moniker for **AppPool** account
 - do not log on to the site with AppPool account
- Some items are **checked out** and **modified** by System Account account
- Some items are **created** by the System Account

Portal Cache Users

- Portal Super User
 - reads all items including the drafts
- Portal Super Reader
 - reads only the published items
- Cache then checks if the **calling user has permission** to view the drafts and returns appropriate results
 - cache requests made only under two accounts and permissions validated "in application logic"

Default Portal Cache Users

- Portal Super User
 - by default **System Account**
 - performance problems
 - the checked out items must be downloaded twice
- Portal Super Reader
 - by default **NT Authority\Local Service**
 - does not work correctly with Claims Based Authentication
 - Access Denied for sites with SharePoint Server Publishing Infrastructure, Metadata Navigation or Content Query Web Part

Changing Portal Cache Users

- Define new AD accounts
 - **define dedicated user accounts**
 - the performance problem with checked-out items would be the same as with the System Account
- Define User Policy for both accounts
 - SuperAccount = Full Control
 - SuperReader = Full Read
- Assign the accounts to each application
 - use correct identity! (`i:o#.w|gps\sp-intranet-cs`)
- Enable **Publishing Features** for each site collection and all sites

Lab: Portal Users and Cache

- Create two AD user accounts
 - `sp-superuser`
 - `sp-superreader`
- Define application policies for <http://intranet>
 - `sp-superuser` – Full Control
 - `sp-superreader` – Full Read
- Assign portal cache users by using PowerShell
 - `$wa = Get-SPWebApplication`
 - `$wa.Properties['portalsuperuseraccount'] = 'i:o#.w|gps\sp-superuser'`
 - `$wa.Properties['portalsuperreaderaccount'] = 'i:o#.w|gps\sp-superreader'`
 - `$wa.Update()`

Lab: BLOB Cache

- Open **web.config** for <http://intranet> web application
- Create **E:\SP-Intranet-Cache**
 - sp-intranet = Full Control
- Modify **<BlobCache>** element
 - enabled="true"
 - location="E:\SP-Intranet-Cache"

Web Applications

PERMISSIONS

Users

- Get-SPUser
- Move-SPUser

Access Control

- Permissions and inheritance
 - item/folder level
 - library/list level
 - site level
 - site collection administrators
- Groups/Users defined at site collection level
- Permission Levels
- User Policies at web applications
- User Policy Levels

Permission Inheritance

- `SPWeb.HasUniquePerm`
- `SPWeb.BreakRoleInheritance`
- `SPWeb.RoleAssignments`
 - list of permission entries
- `SPWeb.Update()`
 - must be called to update the settings into database

Groups

- `SPWeb.SiteGroups`
 - list of site collection defined groups
- `SPGroup = SPWeb.SiteGroups.Add`
- `SPGroup.AllowMembersEditMembership`
- `SPGroup.Update()`
 - must be called to upload changes to SharePoint

Users

- `SPUser = SPWeb.EnsureUser(login)`
- `SPGroup.AddUser(SPUser)`

Permission Levels

- `SPWeb.RoleDefinitions["Contribute"]`
- `SPRoleAssignment = new-object Microsoft.SharePoint.SPRoleAssignment(SPGroup)`
- `SPRoleAssignment.RoleDefinitionBindings.Add(SPRoleDefinition)`
- `SPWeb.RoleAssignments.Add(SPRoleAssignment)`

User logins (Active Directory)

- **UserInfo** table in content database
 - individual data per site collection
 - never updated
 - bound with **SID**, even in case of Claims authentication
- (Get-SPFarm).MigrateUserAccount
- (Get-SPFarm).MigrateGroup
- **Move-SPUser**
- **Set-SPUser -SyncFromAD**
- stsadm.exe -o migrateuser
 - oldlogin <Domain name\Old user name>
 - newlogin <Domain name\New user name>
 - ignoresidhistory

User logins (FBA/LDAP)

- Bound by the LDAP search attribute value
- If AD LDS attribute changes
 - user must **log in** with the new AD LDS attribute
 - if allowed access by the new attribute value
 - **new UserInfo provisioned**

Web Applications

NETWORK LOAD BALANCING

Load Balancing Mechanisms

- DNS round robin
 - easy, cheap, no failover
- Network Load Balancing
 - easy, cheap, no devices required, may have problems with client state vs. excessive authentication traffic
 - precise load % distribution, restrict TCP/UDP ports
- Cookie-based HTTP proxy
 - expensive, the best from client state perspective
 - cookies are no security issue

DNS Round Robin

- **Balancing**
 - may be good to decrease TTL of the A records
- **No failover**
 - timeouts when a node is down
 - examples: ping, Word 2010 timeouts on first IP address unavailable
 - examples: IE7+, shared files, MSINFO32 can use the other IPs

Network Load Balancing (NLB)

- **No affinity (SHA-1 SourceIP:SourcePort)**
 - may have problems with SP 2010 with AD FS
 - more authentication traffic with NTLM
 - problems with application state/cookies
- **Single affinity (SHA-1 SourceIP)**
 - not required with SP 2013 with AD FS
 - more stable state, not good for proxy clients
- **C class affinity (SHA-1 SourceIP.IP.IP)**
 - little use on intranets

NLB Modes

- Unicast
 - unicast MAC address
 - the same MAC address on all nodes
 - no inter-node communications on the cluster NIC
 - must have inter-cluster NIC
- Multicast
 - multicast cluster MAC address
 - every node keeps its own real MAC address
 - no problem for inter-node communications
 - not supported by some switches
- Multicast with IGMP
 - nodes periodically send out IGMP to announce their group membership
 - switch must have IGMP snooping enabled to limit flooding

NLB Client - target cluster MAC

The screenshot shows the Microsoft Network Monitor 3.4 interface. The main window displays a list of captured frames with the following columns: Frame Number, Time Offset, Source, Destination, Protocol Name, and Description. The filter applied is 'ipv4.Address==10.10.0.201'. The frames listed are:

Frame Number	Time Offset	Source	Destination	Protocol Name	Description
39	14.6674030	10.10.0.181	intranet.gpss.vrtual	TCP	TCP-Flags=.....S., SrcPort=51662, DestPort=HTTP(443), PayloadLen=0, Seq=2588581077, Ack=...
40	14.6680737	intranet.gpss.vrtual	10.10.0.181	TCP	TCP-Flags=...A.S., SrcPort=HTTP(443), DestPort=51662, PayloadLen=0, Seq=823669947, Ack=...
41	14.6681542	10.10.0.181	intranet.gpss.vrtual	TCP	TCP-Flags=...A., SrcPort=53062, DestPort=HTTP(443), PayloadLen=0, Seq=2588582078, Ack=...
42	14.6691467	10.10.0.181	intranet.gpss.vrtual	TCP	TCP-Flags=...A.R., SrcPort=51862, DestPort=HTTP(443), PayloadLen=0, Seq=2588581378, Ack=...

The 'Frame Details' pane shows the details for frame 39:

Frame: Number = 39, Captured Frame Length = 64, MediaType = ETHERNET
Checksum: Type = Invariant IP (IPv4), DestinationAddress [00-0F-3A-8A-8B-C9], SourceAddress [02-00-00-00-00-00]
Ips: Src = 10.10.0.181, Dest = 10.10.0.201, Next Protocol = TCP, Packet ID = 2804, Total IP Length = 32
Tcp: Flags=.....S., SrcPort=51662, DestPort=HTTP(443), PayloadLen=0, Seq=2588581077, Ack=0, Win=6192 (Registering 80

Controlling the Host

- Stop/Start
 - stops handling **all** cluster traffic, drops all active connections
 - accepts all cluster commands
- Drainstop
 - stops handling **new** cluster traffic, keeps all active connections
 - after resume it goes to stopped state
- Suspend
 - the same as **stop**
 - after resume it goes to stopped state
 - does not accept any other cluster commands than **resume** and **query**

Scripting NLB

- NLB command line
 - NLBMGR is the GUI console
- WMI
 - root\MicrosoftNLB
 - SELECT * FROM MicrosoftNLB_Node
 - \$node.Stop()
 - \$node.Resume(); \$node.Start()
 - \$node.Suspend()

Cookie-based Proxy Balancing

- HTTP/S proxy issues its own cookie to the clients
- Maintains node affinity according to the cookie
- Office client applications started from browser will target the same node as well

Cookie Requirements for IE vs. Office Sharing

- Enable **Persistent cookies**
- Must reside in **Trusted Sites** zone or disable **Protected mode** for **Intranet Sites**
- Browser **IE 8.0+** or the cookie must not contain **HttpOnly** attribute (client-side scripts no access)
 - Set-Cookie:
jmeno=neco;expires=nekdy;path=/;domain=neco.gopas.cz;HttpOnly

Web Applications

PERFORMANCE MONITORING

Processes

- W₃WP.EXE
 - application pools, compiled in-memory contents
 - web applications, service applications
 - ideally use different user accounts and individual apppools for every service application
- OWSTIMER.EXE
 - jobs, a lot of work :-)
- LSASS.EXE
 - Windows authentication (Kerberos, NTLM)

Performance Monitor

- CPU: %
- CPU: time [hours:minutes]
- Memory: Private working set
- Memory: Pages/sec, Hard faults/sec
- Memory: Virtual memory or Commit charge
 - only in regard to memory leaks and paging file size
- Disk: Queue Length
- Disk: Response Time [ms]
- Disk: Read/Write Bytes/sec
- TCP: connections
- Network Interface: bandwidth?
- W₃C_W₃WP: Requests/sec
- W₃C_W₃WP: Active requests

Web Applications

LDAP AUTHENTICATION

LDAP "authentication" provider

- Not found in Foundation 2010/2013
 - LdapMembershipProvider
 - LdapRoleProvider
